Introduction

This Level 3 hands-on lab guide is part of the IBM watsonx Orchestrate Level 3 course, designed to equip technical sellers with the skills to deliver compelling, client-focused demonstrations of watsonx Orchestrate's agentic AI and automation capabilities. Access the course [here for IBMers](#) or [here for IBM Business Partners](#). The lab provides practical, hands-on experience to showcase how watsonx Orchestrate streamlines enterprise workflows across HR, IT, sales, and more, integrating seamlessly with systems like SAP, Workday, ServiceNow, and open-source tools such as LangChain.

To deliver this demonstration effectively, familiarize yourself with the following key assets:

- **Demo Lab Guide:** Review this guide to master the narration and client-facing delivery techniques for the watsonx Orchestrate demo.
- **Demo Video:** Watch the videos to see the demo in action and refine your presentation style. The video accompanying this lab guide aligns precisely with the demo script for a word-for-word reference.
- **Live Demo Environment:** Access the live demo [here](#) to practice and present the solution directly to clients.

Purpose: This document outlines the steps to set up and deliver a polished, impactful demonstration of watsonx Orchestrate, enabling you to highlight its value in automating complex tasks, driving efficiency, and ensuring compliance through human-in-the-loop oversight and governance.

Narration Guidance: Client-facing narration is presented in **gray (15%) shaded boxes like this one** throughout this guide. Use them to guide your storytelling and engage clients effectively.

Demo overview: watsonx Orchestrate for enterprise automation

The main objective of this demo is to showcase the capabilities of IBM watsonx Orchestrate, an agentic AI and automation platform, in streamlining complex enterprise processes across HR, IT, sales, and more. Technical sellers will learn how to present watsonx Orchestrate as a unified system of engagement that integrates with enterprise systems (e.g., SAP, Workday, ServiceNow, and CRMs) and open-source tools (e.g., LangChain, Langflow) to deliver intelligent, conversational workflows. This demo highlights practical applications—such as retrieving payslips, generating employment letters, recommending health plans, and resolving IT issues—while emphasizing key differentiators like human-in-the-loop oversight, governance, and Role-Based Access Control (RBAC). Sellers will gain insights into articulating the platform’s value, including significant time savings (thousands of hours monthly), rapid deployment with prebuilt agents (2-6 weeks), and compliance-driven guardrails. By demonstrating real-world task automation and seamless multi-system integration, this demo equips sellers to address client pain points around efficiency, scalability, and secure AI adoption in enterprise settings.

Product disclaimer

IBM watsonx Orchestrate is an actively developed platform, released iteratively using an agile approach. As we enhance capabilities and refine the user experience, the interface and functionality may evolve. Consequently, screenshots in this lab guide may differ slightly from the current product interface. These changes should not impact the core functionality of the demo, but we encourage you to explore the environment with patience and adaptability.

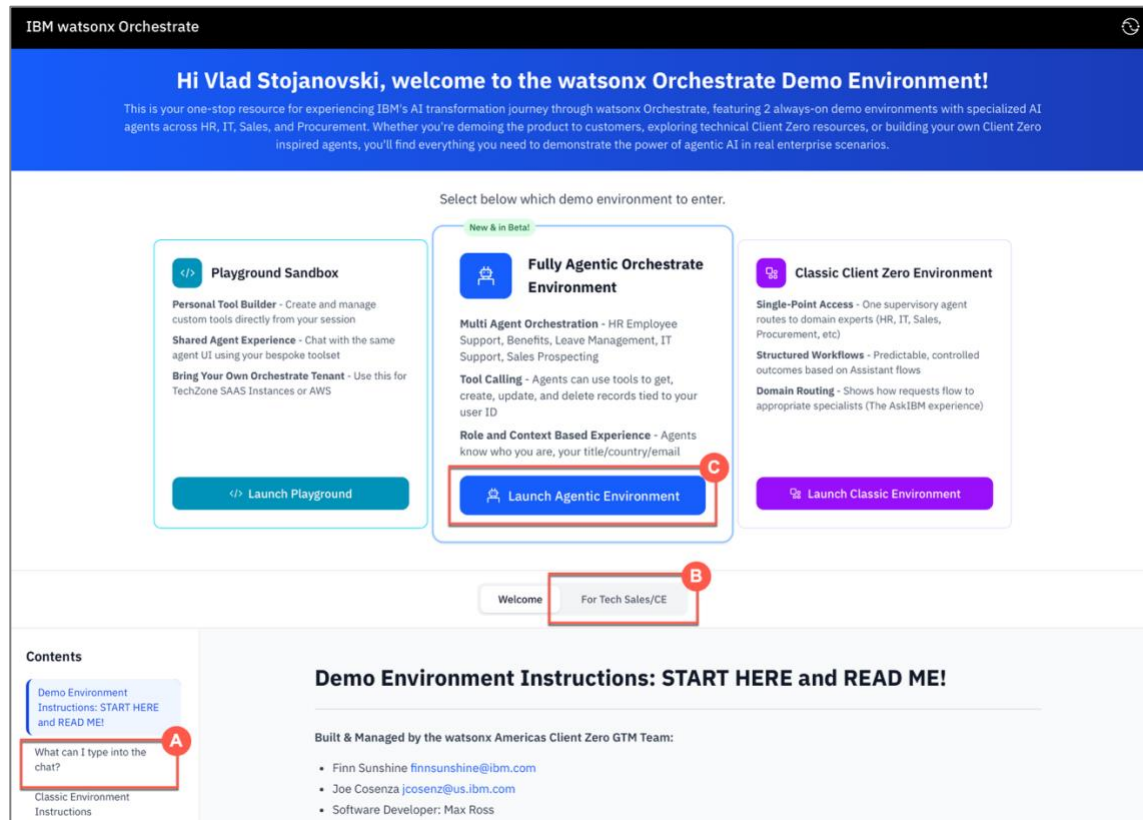

Be aware of the following factors that may influence demo outcomes:

- **Input Sensitivity:** Foundation models are highly sensitive to input variations. Even minor differences in phrasing, such as a single word or altered data labels, compared to the lab’s examples may lead to different results.
- **Model Updates:** Ongoing model tuning and updates may cause variations in outputs. As models are refined, you may experience different results from what is shown in this lab guide.

Prerequisites and setup

To access this demo, IBMers must use a w3id for authentication. Currently, the demo is not available to IBM Business Partners, but efforts are underway to enable access via authorized IBMids through the IBM PartnerPlus program in the near future.

IBMers: Access the demo site [here](#). After authentication, you will be directed to the demo landing page, shown below:

Explore the Landing Page: This guide covers three key links to prepare you for the demo:

A. **What can I type into the chat?**

This link provides a comprehensive list of recommended prompts, including some used in this lab. Review these prompts thoroughly to tailor your client presentations. Practice each prompt in advance to ensure consistent and expected results during your demo.

B. **For Tech Sales/Client Engineering**

This link directs to a GitHub repository containing code for building an agent similar to the one in this demo. While beyond the scope of this lab, you can explore advanced agent development in the watsonx Orchestrate Level 4 course.

C. **Launch Agentic Environment**

Click this button now to enter the demo environment and begin showcasing watsonx Orchestrate's capabilities.

D. When prompted to enter the ISC opportunity link, you can click **Skip** (D) and continue to the environment.

Use case introduction

This section provides a compelling demo opening to kick off your client presentation, setting the stage for a powerful showcase of IBM watsonx Orchestrate. Aligned with the sales pitch, it introduces the platform's agentic AI and automation capabilities, contextualizing its value within the demo's enterprise use cases. The opening highlights how watsonx Orchestrate transforms workflows in HR, IT, sales, and beyond by integrating with systems like SAP, Workday, and CRMs, while emphasizing efficiency, governance, and rapid deployment. Use this introduction to capture the client's attention, framing watsonx Orchestrate as a solution that empowers their teams to focus on high-impact work. Refer to the accompanying PowerPoint presentation for supporting slides to enhance your delivery.

Meet watsonx Orchestrate

- Transforms front- and back-office processes
- Virtual teammates that handle repetitive tasks
- Frees teams for strategic, high-impact work
- Relieves burden on subject matter experts

Hello. I'm excited to walk you through a demo that showcases the capabilities of watsonx Orchestrate, an agentic Artificial Intelligence (AI) and automation platform designed to streamline complex business processes for both front- and back-office functions. Imagine—virtual teammates handling repetitive, multi-system tasks—such as retrieving payslips, drafting client emails, generating employment letters, or ensuring compliance—freeing your team for strategic, high-value work. watsonx Orchestrate reduces pressure on subject matter experts, enabling leaders to focus on coaching and business growth.

Why watsonx Orchestrate?

- Seamlessly integrates with enterprise systems like ServiceNow, Salesforce, SAP...
- Delivers a unified, intelligent conversational interface for all employee tasks
- Minimizes manual effort and accelerates ticket resolution

You may wonder, “Why watsonx Orchestrate when we already use AI agents in platforms like Workday, SAP, or Salesforce?” Unlike siloed systems of record optimized for specific domains, watsonx Orchestrate acts as a unified system of engagement. In a world where agentic AI is rapidly transforming work, watsonx Orchestrate unifies your AI strategy by integrating with third-party solutions like ServiceNow and open-source technologies such as LangChain and Langflow. It consolidates these into a simplified, intelligent conversational interface that guides employees and customers through complex tasks, reducing the need for manual intervention or ticket resolution.

Why now: Actionable AI impact

- Proven by IBM’s Client Zero success for 250,000 employees
- Boosts productivity, saving thousands of hours monthly
- Enterprise governance ensures human-in-the-loop compliance and oversight

It integrates seamlessly across platforms using open standards like OpenAPI and Model Context Protocol (MCP). This provides multi-agent coordination, governance, and observability. watsonx Orchestrate delivers a cohesive experience across channels—whether through its built-in chat interface, Slack, Microsoft Teams, voice assistants, website widgets, or as an embedded copilot. And why adopt agentic AI now? While Large Language Models, or LLMs, and Retrieval-Augmented Generation, or RAG, excel at summarizing documents, your business needs agents that act. As IBM’s Client Zero, we built watsonx Orchestrate to perform real work for our employees, not just provide answers. This demo shows how watsonx Orchestrate saves time, ensures human-in-the-loop oversight, and boosts efficiency across Human Resources, sales, and more, with time savings adding up to thousands of hours monthly, and reduced mean-time-to-resolution for support tickets.

A note on personalization

Once you login, you will notice that the demo environment recognizes you, knows your name, and your country. However, the payroll information is fictional. In addition, while the demo may “remember” the holidays you record from one session to another, these are not actual IBM HR records, but are part of the demo context only.

Demo use case detailed script

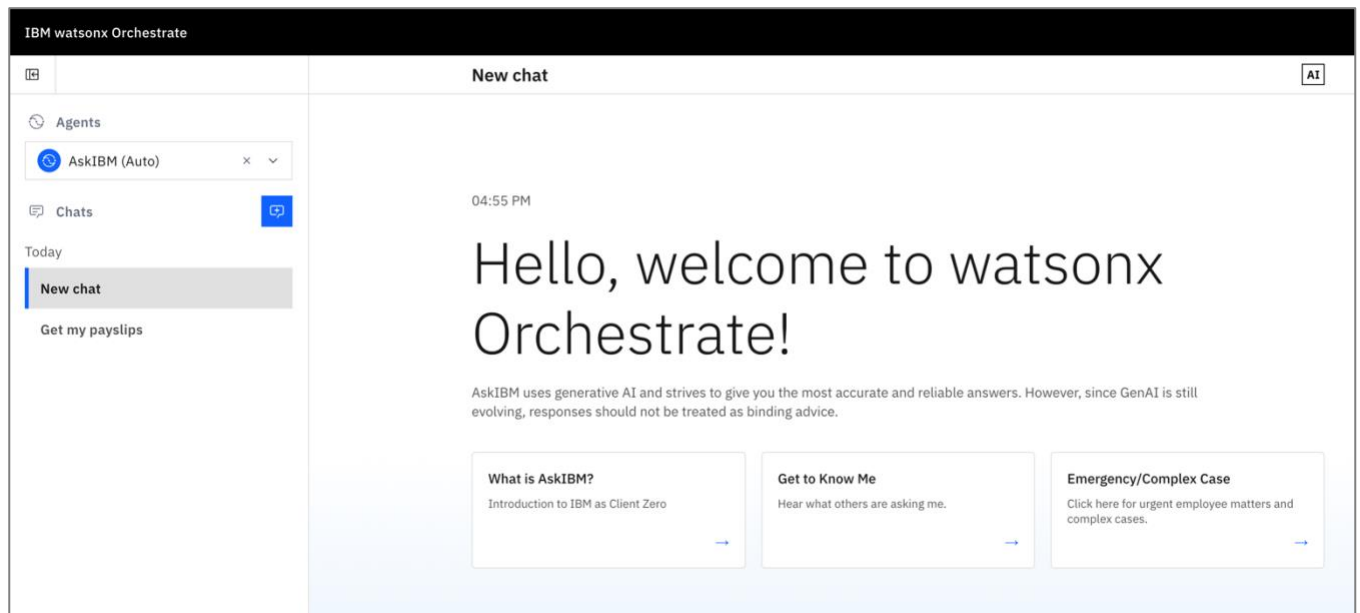

This section provides a step-by-step guide to delivering a compelling demonstration of IBM watsonx Orchestrate, showcasing its context-aware automation capabilities for enterprise tasks. Follow these instructions to engage clients effectively and highlight the platform's value.

Before you start the demo

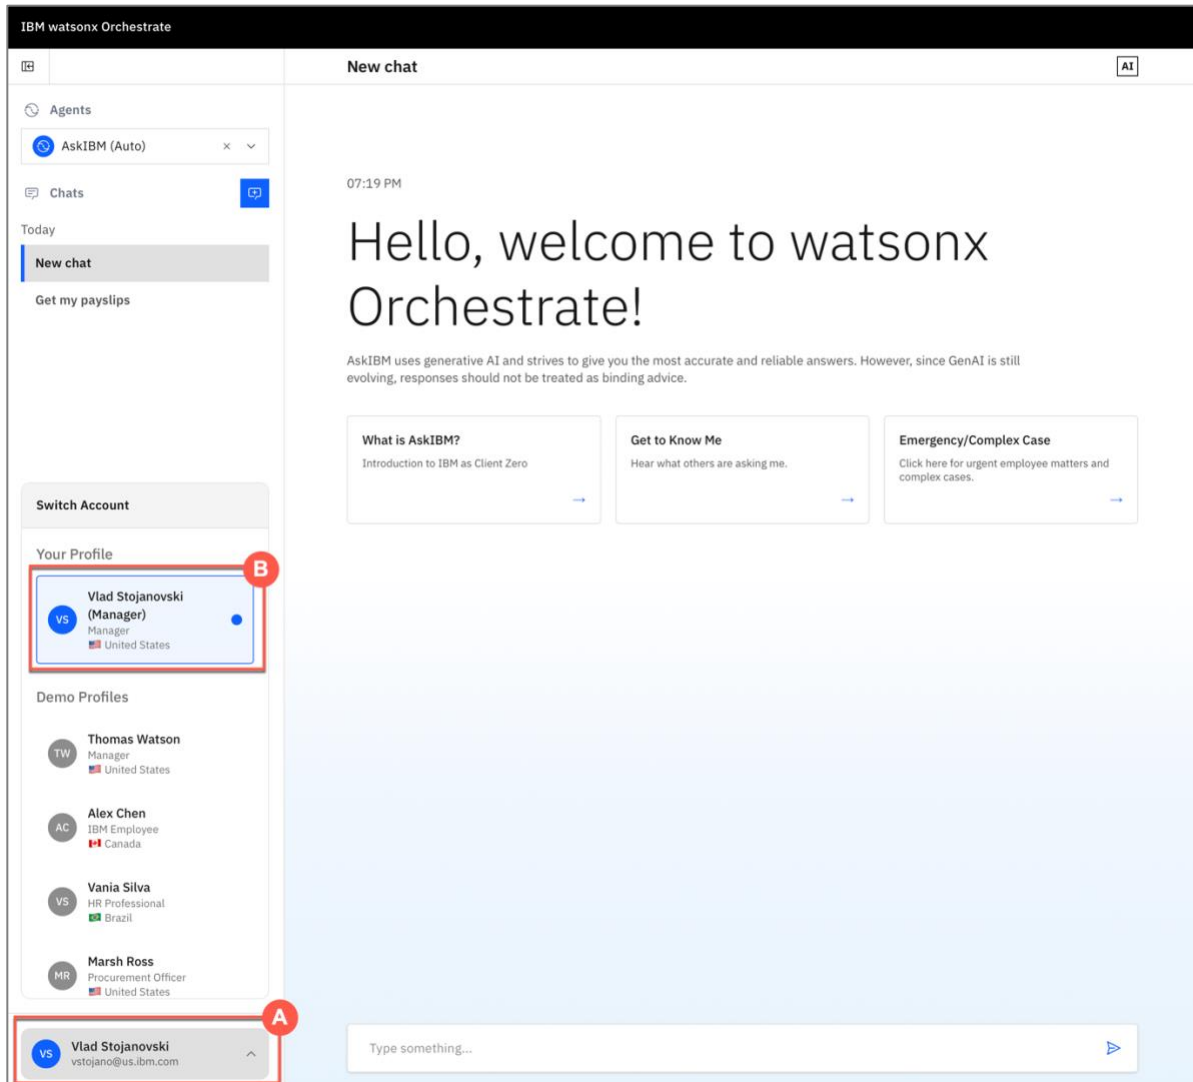

To demonstrate watsonx Orchestrate's ability to deliver personalized, location-specific responses, you will need to set up two browser tabs to compare outputs, such as country-specific holiday data.

1. Follow the process described in the [Prerequisites and Setup section](#) to visit the demo site, then access the demo environment using your w3id.

Upon authentication, you will arrive at the demo landing page.

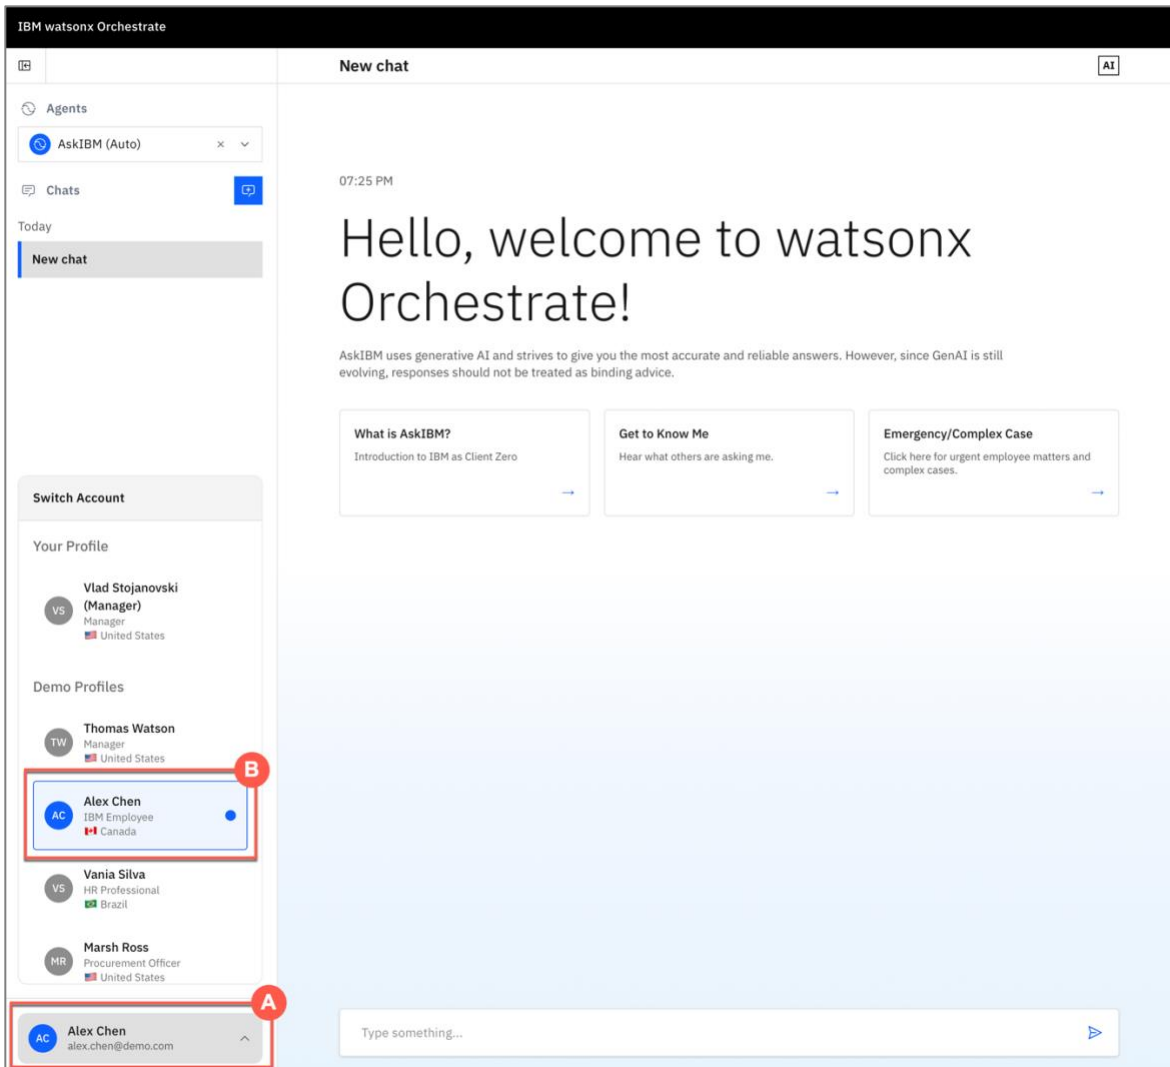

2. In the bottom-right corner, locate your name and profile. Click on **your name** (A) to display your **country location** (B), which defaults to your profile's settings (such as United States, Canada, or Brazil):

3. Copy the URL from the main demo window and open it in a new browser tab.

This second tab will allow you to showcase watsonx Orchestrate's contextual adaptability.

- For example, if your primary profile is set to a US location, in the second browser tab, select the Canadian profile for **Alex Chen** (B) by clicking the **profile selector** (A). If your primary profile is Canadian, choose a US profile such as **Thomas Watson** or **Marsh Ross** instead.

This demo currently supports holiday data for the United States, Canada, and Brazil only. If your primary profile in the first tab is set to a different country, this is not an issue; the demo instructions later in this guide will provide guidance on adapting the flow. This ensures a smooth and relevant presentation for all clients.

Note that while the demo will pull your personal details including your name, email address and country code, the HR data (such as salary, device information and available time off) is fictional; no other personal data is revealed.

5. Return to your first demo tab, displaying your profile name, to begin the demonstration.

Start the demo

This demo shows how watsonx Orchestrate saves time, ensures human in the loop oversight, and boosts efficiency across human resources, sales, and other domains, with time savings adding up to thousands of hours monthly and reduced mean time to resolution for support tickets.

As you will see, AskIBM, an orchestrator agent, empowers IBM employees to address daily needs like human resources matters or information technology support without needing to interact directly with the underlying systems such as SAP, Workday, or ServiceNow.

The intuitive interface sends the queries to specialized virtual teammates - AI agents like AskHR for payslips or paid time off, AskSales for client outreach, or AskIT for support tickets - delivering secure personalized responses using retrieval assistant augmentation (RAG) and backend system tools.

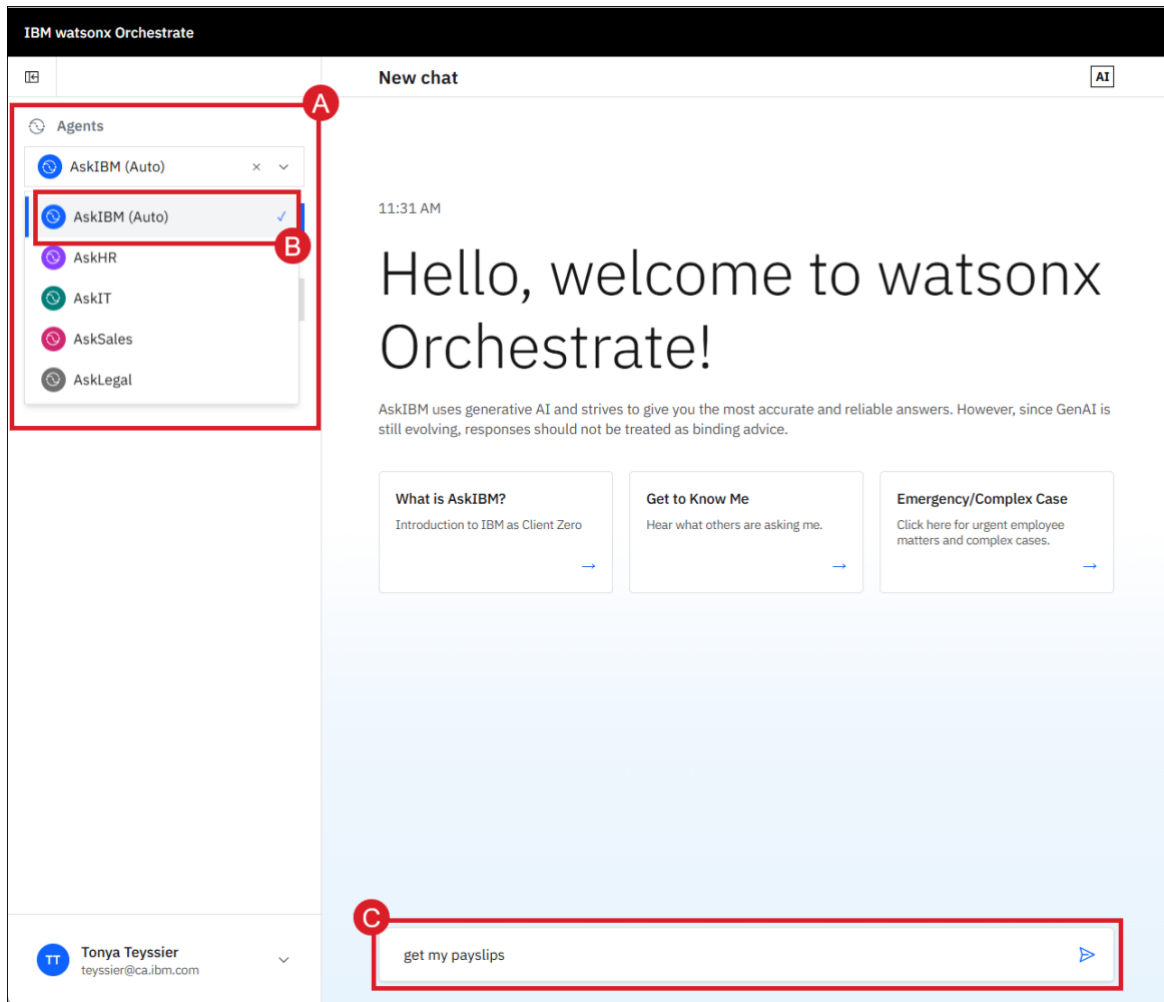

Employees maintain control through human-in-the-loop approvals and feedback mechanisms like *thumbs up* or *thumbs down*.

Let's begin with a common need: "Get my pay slips".

Viewing pay slips and opening an HR ticket

1. In your primary browser tab, click the Agent list (A) to display the different collaborator agents, and then select **AskIBM** (B).
2. On the **New chat** page, enter the following prompt (C) to get payslips:

Get my payslips

Here's what happened:. AskIBM routes the pay slip query to the AskHR agent, which retrieves pay slip data instantly from the human resources system using my ID, eliminating portal navigation.

Role-based access control ensures I only see my own pay data, maintaining security. However, I see a problem with one of the paychecks.

3. Enter the following prompt to request support. This prompt starts a workflow that corrects the issue:

I need HR support

4. When AskHR responds offering to help, enter the following prompt to explain the problem:

There's an issue with the amount on my October 1 – October 15, 2025 payslip

AskHR understands that my issue is not something it can answer using its knowledge, so it creates a support request. To create the request, it auto-categorizes the issue and creates a human resources support ticket based on context.

- NOTE: You might be prompted to confirm the title of the support ticket and the urgency level. If so, confirm the title (A) and for the urgency level, enter: medium (B)

AskHR generates the ticket and provides the details in the chat (C).

- Click the thumbs-up icon (D) to validate that the request was handled correctly.

IBM watsonx Orchestrate

Get my paylips

To confirm, would you like the title of the ticket to be: **Payroll Issue - Incorrect Pay Amount on Payslip?**

yes

AskHR 12:25 PM Show Reasoning

I'm sorry, I encountered an issue when trying to create your ticket. The system requires an urgency level for the ticket.

What **urgency** would you like to set for this ticket (Low, Medium, High, or Critical)?

medium

AskHR 12:27 PM Show Reasoning

I've successfully created an HR support ticket for you, Tonya. Here are the details:

Component	Details
Ticket ID	HR102218
Category	Payroll
Subject	Payroll Issue - Incorrect Pay Amount on Payslip
Description	Submitted by: Tonya Teyssier (teyssier@ca.ibm.com) Employee reports an incorrect amount on their payslip for the period of October 1 – October 15, 2025.
Status	New
Urgency	Medium
Created On	2025-10-22 09:25:18

An HR partner will review this ticket and get back to you soon.

thumbs-up

TT Tonya Teyssier
teyssier@ca.ibm.com

Type something...

This type of employee self-service and human resources task automation frees recruiters and payroll professionals for higher value tasks. It also delivers a frictionless digital first experience, unlike navigating multiple screens and systems like SAP SuccessFactors. It saves 10 minutes per payslip retrieval compared to portal navigation, and 15 minutes per ticket creation compared to manual forms. At 1500 monthly requests, that's 250 to 500 hours saved.

Verifying holidays

Next, I will ask, can you show me the holidays I have left for the rest of the year?

1. Enter the following prompt (A) to find out the number of remaining holidays for the year:

Can you show me the holidays I have left for the rest of the year?

The screenshot displays the IBM watsonx Orchestrate interface. On the left, a sidebar shows the 'Agents' section with 'AskIBM (Auto)' selected, and the 'Chats' section with 'Get my payslips' highlighted. The main area is titled 'Get my payslips' and contains a table with the following details:

Category	Payroll
Subject	Payroll Issue - Incorrect Pay Amount on Payslip
Description	Submitted by: Tonya Teyssier (teyssier@ca.ibm.com) Employee reports an incorrect amount on their payslip for the period of October 1 – October 15, 2025.
Status	New
Urgency	Medium
Created On	2025-10-22 09:25:18

Below the table, a message states: 'An HR partner will review this ticket and get back to you soon.' There are thumbs up and thumbs down icons.

A red box labeled 'A' highlights a user prompt: 'Can you show me the holidays I have left for the rest of the year?' with a timestamp of '10:12:47 PM'.

Below this, a response from 'AskHR' at '12:49 PM' is shown with a 'Show Reasoning' dropdown. The response text is: 'Here are the remaining holidays for the rest of 2025 in Canada, Tonya:'

Holiday	Date
Remembrance Day	November 11, 2025
Christmas Day	December 25, 2025
Boxing Day	December 26, 2025

At the bottom, there is a chat input area with the placeholder text 'Type something...' and a send button. The user's profile 'Tonya Teyssier' with email 'teyssier@ca.ibm.com' is visible in the bottom left corner.

AskIBM routes the query to the AskHR agent, which retrieves remaining holidays, such as Christmas Day, from SAP SuccessFactors using my profile, specific to my country.

Note: If this prompt does not function appropriately for your location, you can either skip it or select an alternative from the curated list of recommended prompts, as discussed in the **Prerequisites and Setup** section of this guide.

2. Click **Show Reasoning** (A) to see the source information for the response.

If I click **Show reasoning**, I can see that the agent is using the `get_holiday_calendar` tool (B), passing it my country code. These are the country-specific holidays, and when I click on my profile, you can see that matches the country associated to my profile.

3. In the lower-left of the screen, click your name to open your profile (C) to view your profile country (D).

The screenshot displays the IBM watsonx Orchestrate interface. On the left, a sidebar contains 'Agents' (AskIBM (Auto)), 'Chats', and a 'Today' section with 'Get my payslips'. Below this is a 'Switch Account' section with 'Your Profile' (Tonya Teyssier, IBM Employee, ca Canada) and 'Demo Profiles' (Thomas Watson, Alex Chen, Vanía Silva, Marsh Ross). The main area shows a chat conversation with 'AskHR' at 01:13 PM. The chat message is 'Can you show me the holidays I have left for the rest of the year?'. Below the message is a table of remaining holidays for 2025. A 'Show Reasoning' button (A) is next to the message. The reasoning panel (B) shows 'Step 1' with the tool 'get_holiday_calendar' and its input/output. The input is {'country_code': 'CA', 'year': '2025'}. The output is a JSON object with 'total': 12 and a list of holidays. At the bottom left, the user's profile card (C) is highlighted, showing 'Tonya Teyssier' and 'teyssier@ca.ibm.com'. A red box (D) highlights the country 'ca Canada' in the profile card.

AskHR 01:13 PM

Can you show me the holidays I have left for the rest of the year?

Here are the remaining holidays for you in Canada for the rest of 2025:

Holiday	Date
Remembrance Day	November 11, 2025
Christmas Day	December 25, 2025
Boxing Day	December 26, 2025

Step 1

Tool: get_holiday_calendar

Input

```
{ "country_code": "CA", "year": "2025" }
```

Output

```
{
  'total': 12,
  'holidays': [
    {
      'Holiday': 'New Year's Day',
      'Date': 'January 1, 2025'
    },
    {
      'Holiday': 'Good Friday',
      'Date': 'April 18, 2025'
    },
    {
      'Holiday': 'Easter Monday',
      'Date': 'April 21, 2025'
    },
    {
      'Holiday': 'Victoria Day',
      'Date': 'May 19, 2025'
    },
    {
      'Holiday': 'Canada Day',
      'Date': 'July 1, 2025'
    },
    {
      'Holiday': 'Civic Holiday',
      'Date': 'August 1, 2025'
    }
  ]
}
```

4. Open the second browser window where you are logged in with an employee profile from a different country and enter the same prompt as in the previous step (A):

Can you show me the holidays I have left for the rest of the year?

In a separate window, I am logged in as another individual from a different country (B). As you can see in this case, watsonx Orchestrate retrieves holidays specific to that country (C).

AskHR 01:32 PM Show Reasoning

Here are the remaining company holidays for the rest of 2025 in the United States:

Holiday	Date
Thanksgiving Day	November 27, 2025
Day After Thanksgiving	November 28, 2025
Christmas Day (Observed)	December 25, 2025

Type something...

Again, this eliminates manual navigation through SAP success factors, providing a quick conversational alternative to traditional system queries. It also demonstrates single sign on and role-based access control integration, inheriting my role and location from the identity provider.

Scheduling a vacation day

Now, I'd like to book a personal choice holiday, but I'm not sure if I have any left. So I type, book a personal choice holiday for the Wednesday before Thanksgiving, but only if I have personal holidays left to use.

1. Navigate away from your secondary browser window back to your original Orchestra browser window. Then, enter the following prompt (A) to schedule a holiday if possible:

Book a personal choice holiday for the Wednesday before Christmas, but only if I have personal holidays left to use

Here's what's happening. AskHR interprets Wednesday before Christmas as December 23, 2026 (B).

Note: You can try other variations, such “the day after Boxing Day” or “the day before Thanksgiving” for more optimal results specific to your country location.

2. Click **Show reasoning** (C).

IBM watsonx Orchestra

Get my paystips

Holiday	Date
Remembrance Day	November 11, 2025
Christmas Day	December 25, 2025
Boxing Day	December 26, 2025

You 01:40 PM

Book a personal choice holiday for the Wednesday before Christmas, but only if I have personal holidays left to use

AskHR 01:40 PM **Show Reasoning**

You have **4 days of Personal Choice Leave** available, so you have enough balance for this request.

The date you requested **Wednesday, December 24, 2025** is the day before Christmas Day, which is a company holiday.

Would you like me to go ahead and book **December 24, 2025** as a **Personal Choice Leave** for you?

Tonya Teyssier
teyssier@ca.ibm.com

Type something...

When I click **Show reasoning**, I can see that it checks my available personal choice holidays using the `get_time_off_balances` tool (A). Next, it confirms that I've already been approved for this date, with days remaining (B).

This shows how watsonx Orchestrate handles complex, multi-intent queries by breaking them into steps (C), ensuring accuracy without redundant actions.

The screenshot displays the IBM watsonx Orchestrate interface. On the left, a sidebar shows 'Agents' with 'AskIBM (Auto)' selected and 'Chats' with 'Get my payslips' selected. The main chat area shows a conversation with 'AskHR' at 01:40 PM. The user's message is: 'Book a personal choice holiday for the Wednesday before Christmas, but only if I have personal holidays left to use'. The AI's response is: 'You have 4 days of Personal Choice Leave available, so you have enough balance for this request. The date you requested, Wednesday, December 24, 2025, is the day before Christmas Day, which is a company holiday. Would you like me to go ahead and book December 24, 2025 as a Personal Choice Leave for you?'. Below the chat, a reasoning trace is shown with three steps: Step 1 (Tool: get_time_off_balances, marked with a red box and 'A'), Step 2 (Tool: check_day_of_week, marked with a red box and 'C'), and a third step (marked with a red box and 'B') which is partially obscured by a wavy line. The output of Step 1 is a JSON object containing user information and leave balances. The output of Step 2 is a JSON object containing dates.

This saves 15 minutes per request compared to manual checks and submissions. At 1500 monthly requests, that's 375 hours saved. Human in the loop is key that allows me to confirm the request details.

Finding a health plan

Now, I'd like some help in finding a health plan for me and my family.

1. Enter the following prompt (A) to find a health plan:

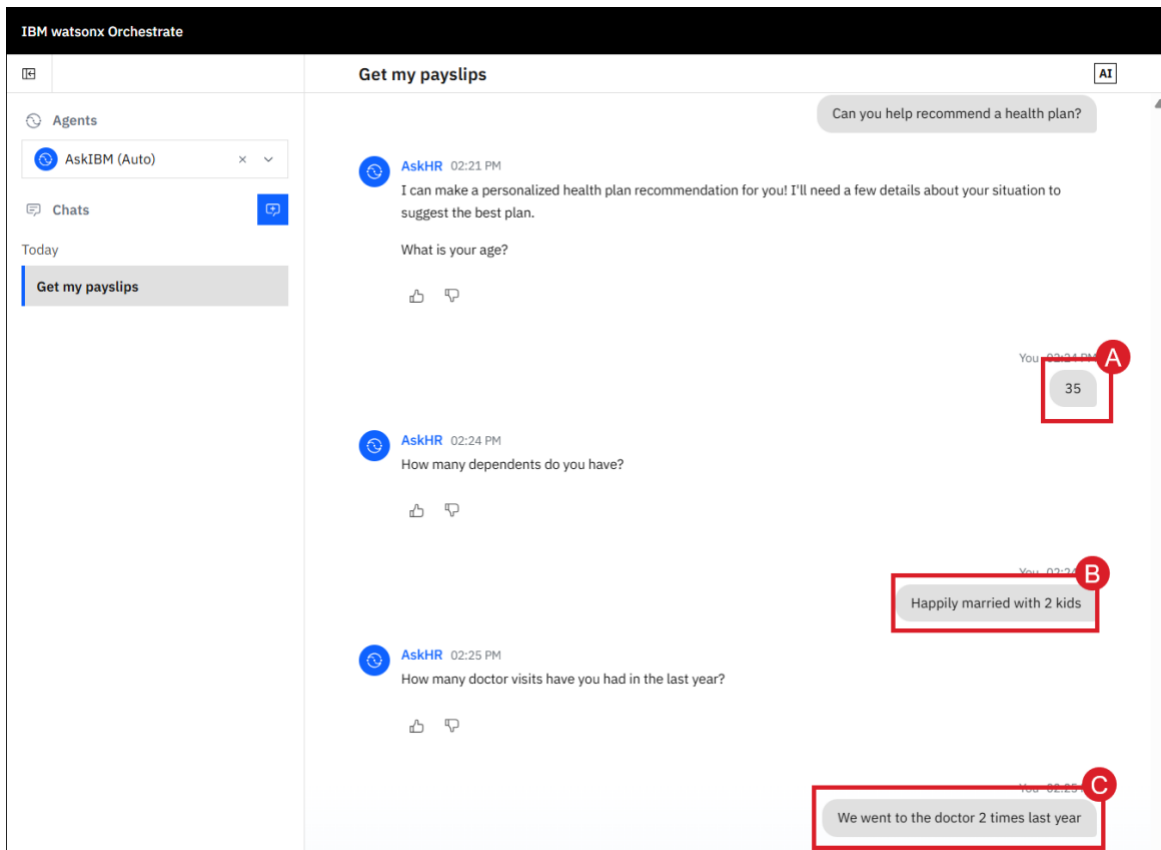

Can you help recommend a health plan?

In response, AskHR requests details: age, marital status, dependence, and doctor visits.

2. When prompted enter the following details:

- Age (A): I 'm 35
- Dependents (B): Happily married with 2 kids
- Number of doctor visits in the past year (C): We went to the doctor 2 times last year

Note: If AskHR asks a single question, answer with a single response: 35, married with 2 kids, 2 doctor visits

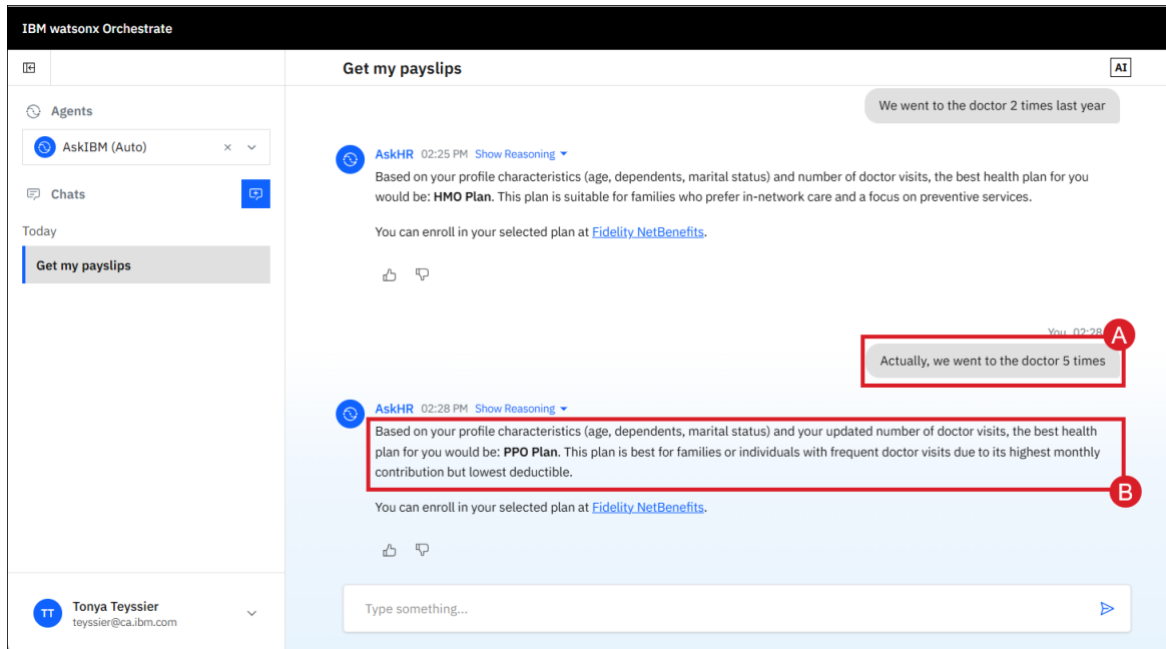

Based on my responses and its business rules, which may include files that contain age ranges and number of dependents, it uses the `get_health_plan` recommendation tool to make a recommendation.

But then, I correct myself.

3. After the response from AskHR, enter the following prompt (A) to correct the number of doctor visits:

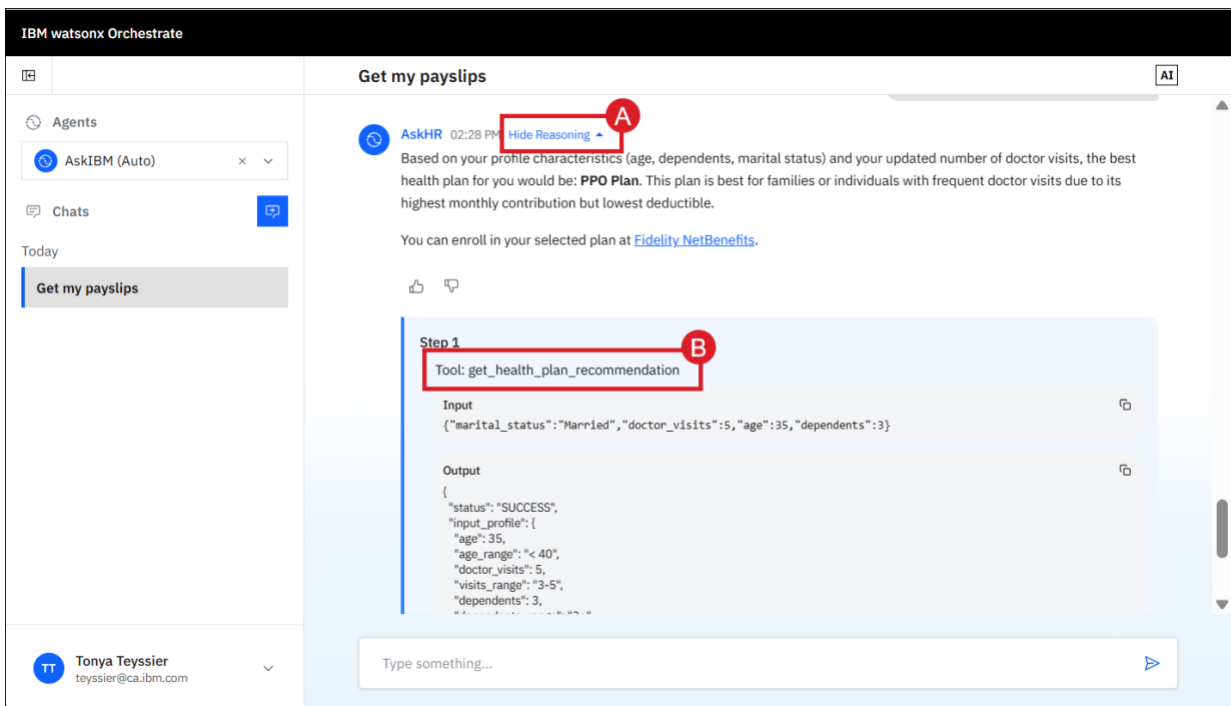

Actually, we went to the doctor 5 times

watsonx Orchestrate changes its recommendation based on this update in the number of doctor visits (B).

- Click **Show Reasoning** (A).

What you are seeing is dynamic adjustment based on updated inputs grounded in business rules to avoid hallucination. This can be seen in the `get_health_plan_recommendation` tool (B) when I show the reasoning.

These personalized recommendations are driven by business rules, not LLM predictions, in compliance with IBM's enrollment policies. It showcases deep linking in human resources, providing links to benefits providers like Fidelity NetBenefits, with or without API integration, ensuring AskHR is the single-entry point. This saves 20 minutes per recommendation compared to manual benefits research. At 1000 monthly inquiries, that's 333 hours saved.

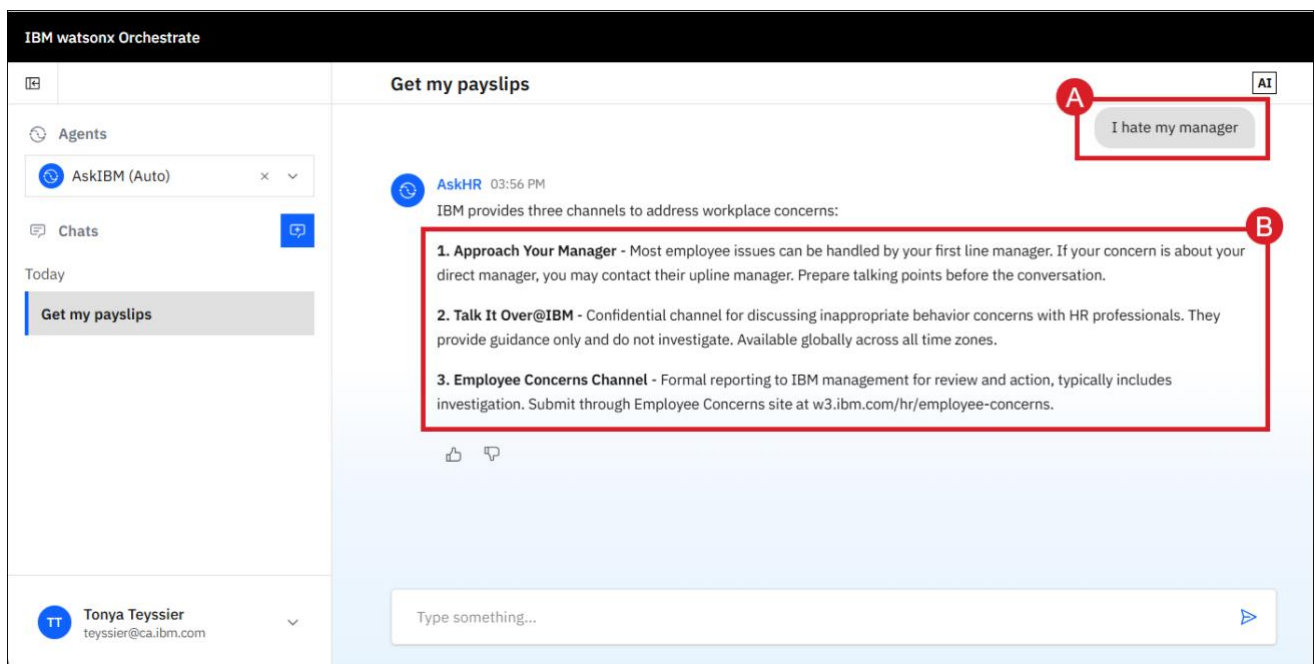

Human-in-the-loop here again is key. I provide the information and confirmation.

Testing the AI's guardrails

Now, let's test the guardrails of our agentic AI.

1. Enter the following prompt to complain about your manager (A):

I hate my manager

Here's what's happening: watsonx Orchestrate's guardrails detect toxic language, avoiding inappropriate responses like, "Sorry, your manager's the worst." Instead, it redirects to proper human resources support channels (B).

This is how governance prevents hallucination and ensures responsible AI. This matters because built-in governance protects against liability and ensures compliance for IBM's 250,000 global employees.

Integrating multiple enterprise systems

Next, let's observe how watsonx Orchestrate integrates enterprise systems.

1. Enter the following prompt to create an employment verification letter (A):

Generate an employment verification letter

2. When prompted, provide the following information:
 - Who the letter should be sent to (B): just to me
 - Include salary details (C): yes
 - Confirm generating and emailing the letter despite containing personal information (D): confirmed
3. After AskHR responds with the message about successfully generating and emailing the letter, click **Show Reasoning** (E).

The screenshot displays the IBM watsonx Orchestrate chat interface. On the left, a sidebar shows the 'Agents' section with 'AskIBM (Auto)' selected, and a 'Chats' section with a 'Get my payslips' chat active. The main chat area is titled 'Get my payslips' and shows a conversation with 'AskHR'. The chat history includes:

- A user message (A) in a red box: 'Generate an employment verification letter'.
- An AskHR response (04:02 PM) asking if the letter should be sent to the user's IBM email address or directly to a third party.
- A user message (B) in a red box: 'just to me'.
- An AskHR response (04:06 PM) asking if salary details should be included.
- A user message (C) in a red box: 'yes'.
- An AskHR response (04:06 PM) with a 'Show Reasoning' dropdown, explaining that the verification letter will contain personal information (PI) and must be encrypted with a password.
- A user message (D) in a red box: 'confirmed'.
- An AskHR response (04:06 PM) with a 'Show Reasoning' dropdown (E) stating: 'I have successfully created and sent your verification of employment letter to your IBM email address. I have also sent the encryption password to your IBM email address.'

The bottom of the interface shows a user profile for 'Tonya Teyssier' and a text input field with the placeholder 'Type something...'.

Behind the scenes, here's what is happening during this request as I expand show reasoning: AskHR uses the `generate_employment_verification_letter` tool to generate the letter (A). Then, it uses the `send_mail` tool to email it (B).

AskHR 04:06 PM [Hide Reasoning](#) ▲

I have successfully created and sent your verification of employment letter to your IBM email address. I have also sent the encryption password to your IBM email address.

Step 1 **A**

Tool: `generate_employment_verification_letter`

Input

```
{ "recipient_email": "teyssier@ca.ibm.com", "salary_tf": true, "user_id": "teyssier@ca.ibm.com", "recipient_name": "Tonya Teyssier", "requestor_name": "Tonya Teyssier" }
```

Output

```
{ "success": true, "timestamp": "2025-10-22T13:05:05.887698+00:00", "verification_url": "https://ibm.biz/EmploymentVerificationLetter", "email_example": "https://ibm.biz/EmploymentLetterEmailExample" }
```

Step 2 **B**

Tool: `send_mail`

Input

```
{ "content_type": "text/plain", "email_address": "teyssier@ca.ibm.com", "subject": "IBM Confidential: Employment verification - Tonya Teyssier", "email_body": "Your employment verification letter is attached. This document is password protected for security. The password has been sent to your IBM email address.", "cc_email_addresses": "teyssier@ca.ibm.com" }
```

Output

```
200
```

Tonya Teyssier
teyssier@ca.ibm.com

Type something...

If I scroll up to the previous step and show reasoning, I can see how AskHR pulls salary details from SAP SuccessFactors using the `get_current_compensation` tool.

Note: The links to the demo letter and email are provided in Step 1 of the AskHR response. You access the links in a later step.

4. Scroll up to the previous AskHR request to authorize generation of the letter and click **Show Reasoning** (A).

The verification of employment letter that I'm about to create will contain your personal information (PI). Following IBM Data Security guidelines, I must encrypt the document with a password, which I will be sending to your IBM email address after you submit the request successfully.

Please **confirm** if you authorize AskHR to generate and send your verification of employment letter to your IBM email address.

Step 1

Tool: get_current_compensation_details

Input

```
{ "country_code": "CA", "user_id": "0A2198649" }
```

Output

```
{  "salary": "C$156,400 CAD (Annual)",  "compa_ratio": "85%",  "compensation_range": "C$108,800 – C$183,600 – C$258,400 CAD (Annual)",  "compensation_range_midpoint": "C$183,600 CAD",  "job_profile": "IBM Sales Professional",  "compensation_grade": "Band 7",  "fte": "100%",  "time_in_band": "9 months",  "last_salary_increase": "3%",  "last_salary_increase_effective_date": "01 January 2025",  "country_code": "CA" }
```

This demonstrates integration across three systems. In production, the letter is emailed, but for the demo, we'll use these links to show the output.

Note: The links point to files in a Box folder, which can be used to illustrate what the emails and the letter look like. In other words, you will not receive an email in your Inbox.

Employee: **John Doe**

The following is the information requested regarding the employment of **John Doe**. We request that this information be kept in confidence.

Most Recent Date of Hire:	01-01-2020
Service Reference Date:	01-01-2020
Position Title:	AI Technical Specialist
Employment Type:	Full time
Employment Status:	Active
Workplace Indicator:	Traditional Office
Work Location:	New York, New York

Annual Base Salary	\$ 80,000.00
---------------------------	---------------------

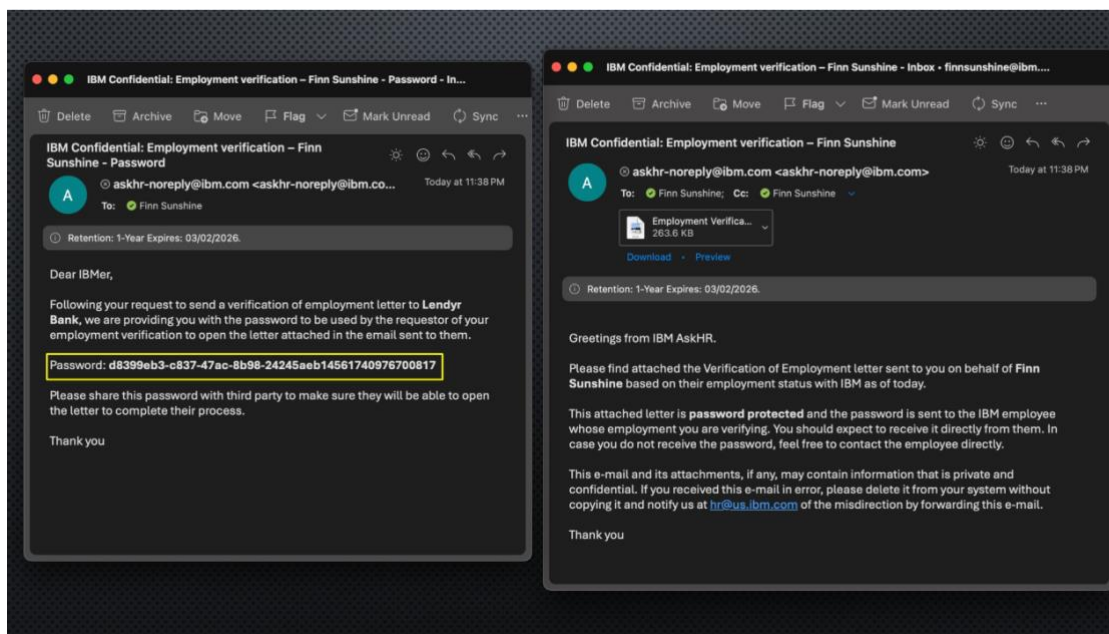

REMARKS: IBM does not release qualitative statements of information, which we consider to be private, regarding current or former employees. Salary information will be released only upon receipt of a signed authorization, consent or release form with salary clearly indicated on the actual signed release document.

Total Earnings which appear on the employee's W2 Statements are correct and can reflect additional income which is not considered 'Salary' earnings as provided through the verification process. This could include awards, personal reimbursements, or travel reimbursements. Also, Overtime, Additional Compensation, Variable Compensation and Sales Incentive Pay can fluctuate from year to year and are not a guaranteed source of income.

Lawrence Sposato
 Director, HR Leader
 IBM CHQ

- The email example at the 2nd URL: <https://ibm.ent.box.com/s/fboszwbk586ccutal6ezgwnxvauak2aw>

This kind of integration complements existing tools like Workday and SAP without requiring rip and replace. It also saves 15 minutes per letter compared to manual multi-system coordination. At 1500 monthly requests, that's 375 hours saved. AI.

At IBM we were also able to eliminate a multi-million dollar third-party contract with a vendor that generated these letters, delivering significant cost savings to the company.

Troubleshooting and requesting a new laptop

Finally, I am having some issues with my laptop.

1. Enter the following prompt to request a new device (A):

My laptop is running slow, can I get a new device?

Without me prompting it specifically, it shows me all my devices and offers to run a diagnostic (B).

2. When prompted to specify which device has the issue, enter the following response (C):

it's my Apple device

The screenshot shows the IBM watsonx Orchestrate interface. On the left, there's a sidebar with 'Agents' (AskIBM (Auto)), 'Chats', and 'Today' (Get my payslips). The main area is titled 'Get my payslips' and shows a chat conversation with 'AskIT'.

Chat History:

- User (A):** My laptop is running slow, can I get a new device?
- AskIT (B):** Here are your registered devices:

Device Name	Model	OS	Status	Location	Last Active
Windows Device	Dell Latitude 7440	Windows 11 Pro	Compliant	New York, NY	10-22-2025 17:44
Apple Device	Macbook Pro	macOS Sequoia 15.6.1	Compliant	Miami, FL	10-22-2025 18:22
Mobile Device	iPhone 16	iOS 18.5	Compliant	Boca Raton, FL	10-22-2025 18:04

Which of these devices would you like me to run a diagnostic on to check battery health and upgrade eligibility?
- User (C):** It's my Apple device

The interface also shows a user profile for Tonya Teyssier (teyssier@ca.ibm.com) at the bottom left.

It runs the diagnostic and shows me that not only is my battery capacity poor, but my device is quite old and in fact eligible for a replacement upgrade.

Behind the scenes, what happened is that AskIBM switched us from the AskHR to the AskIT agent.

This shows seamless domain switching from human resources to IT and intelligent action taking across systems like ServiceNow, enhancing user experience. In turn, AskIT used one tool to check my devices and another to see whether I'm eligible for an upgrade. At 10 minutes per IT request compared to manual ticket creation, times 1500 monthly requests, that's at least 250 hours saved.

Exploring the watsonx Orchestrate Agent catalog (optional)

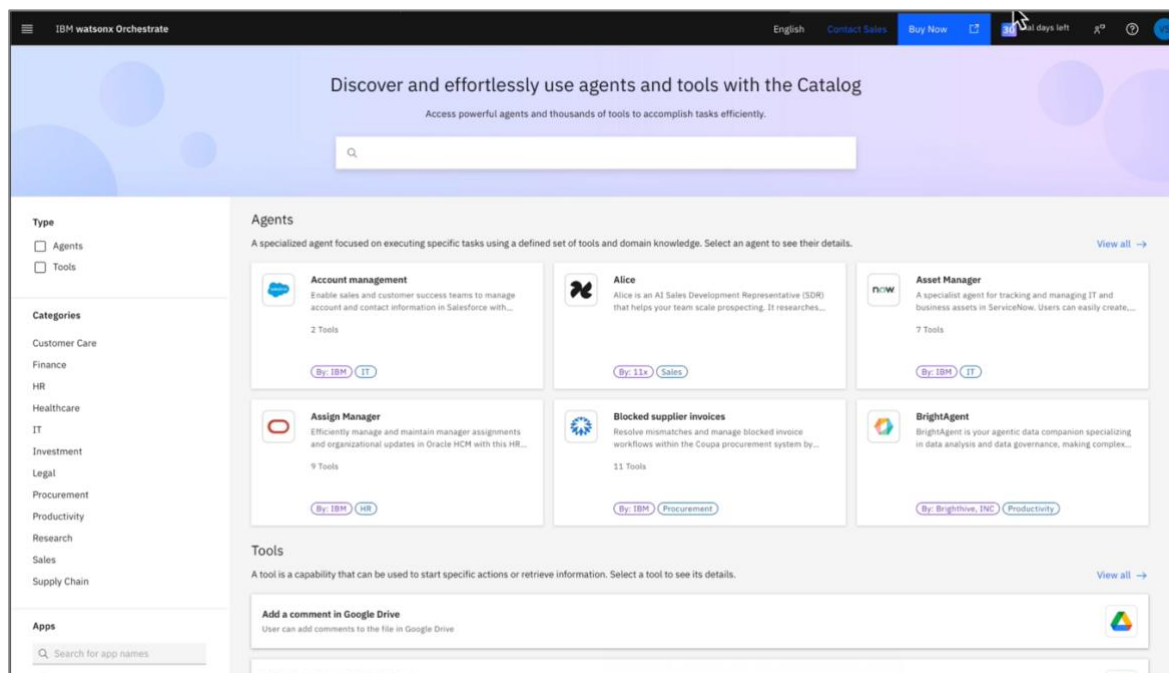

This optional section requires provisioning a watsonx Orchestrate instance on IBM TechZone or on IBM Cloud. The instructions for provisioning and navigating through a live instance of watsonx Orchestrate are beyond the scope of this document. You can learn more about provisioning and navigating through watsonx Orchestrate in the watsonx Orchestrate Level 4 course.

If you have this knowledge, open a separate browser tab, and navigate to the Agent catalog through the navigation menu on the left.

Finally, let's explore the watsonx Orchestrate catalog with hundreds of pre-built agents and tools.

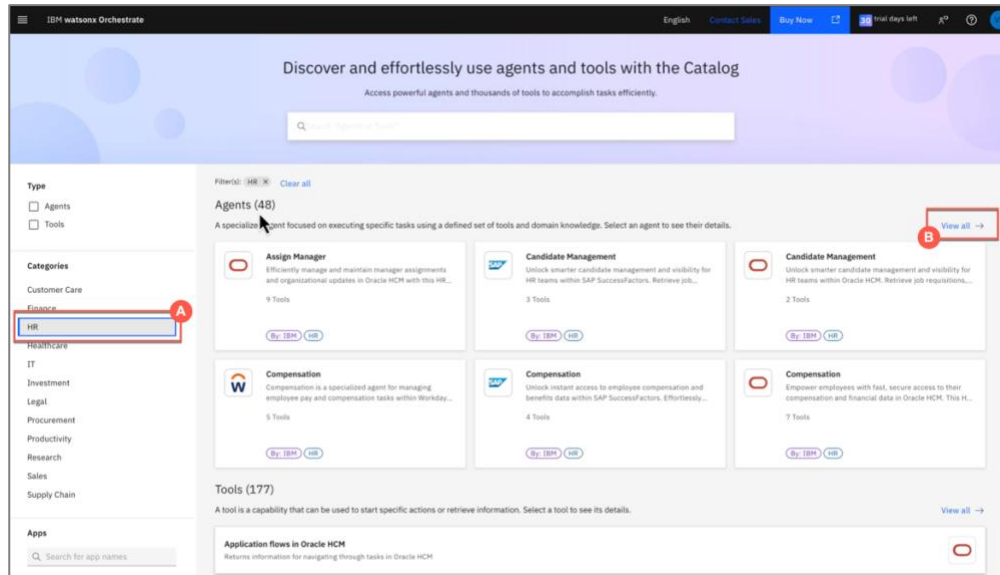

1. Open your browser tab showing the watsonx Orchestrate Agent catalog.

The catalog features pre-built agents for human resources, IT, sales, procurement, and more tested in the As IBM solution.

-
2. In the left navigation pane, click **HR (1)** and in the upper right, click **View all (2)** to scroll through the list.

For example, I see we have 48 agents and 177 tools under the human resources category.

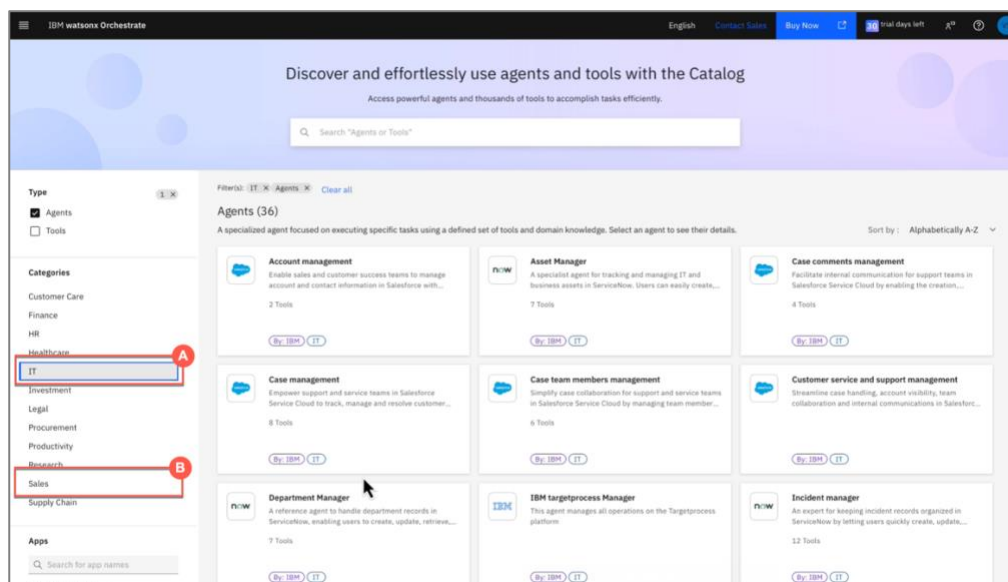

-
-
3. In the left navigation pane, click **IT (A)** and scroll through the list.

Similarly, I have 36 agents under the IT category.

-
-
-
4. In the left navigation pane, click **Sales (B)** and scroll through the list.

Pre-built agents deliver production ready, minimum viable products to IBM clients in 2-6 weeks, accelerating time-to-value. This reduces custom development, enabling rapid onboarding in weeks, not months.

Wrap up

In closing, IBM's experience as client ensures we've addressed pitfalls, paving the way for your success.

This demo showcased watsonx Orchestrate as a virtual team of AI agents transforming human resources, sales, IT, and more through As IBM, unifying your agentic AI strategy with advanced transactional systems.

It automates tasks like pay slip retrieval, employment letters, and holiday queries, totaling thousands of hours in monthly executions.

These intelligent actions grounded in business rules and data deliver real value by enabling employees to focus on high impact work while maintaining compliance and accuracy.

With human in the loop approvals and feedback, employees maintain control while teams across the enterprise, whether human resources, IT, sales, and so on, focus on strategic roles, redirecting talent to high value tasks like coaching and more complex employee support.

Let's discuss next steps or open up for questions and answers.

Guidance for non-English speaking audiences

The AskIBM Client Zero demo is optimized primarily for English-speaking audiences. It has been secondarily tested and validated for the following languages:

- Spanish
- French
- German
- Italian
- Japanese
- Korean
- Portuguese

Additionally, the underlying LLM in AskIBM may correctly interpret and respond to queries in other languages, though performance is not guaranteed.

Best Practices for Non-English Demos

When demonstrating AskIBM in a language other than English, adhere to these guidelines:

1. **Use a single language per conversation thread.** Avoid mixing languages (e.g., English and Spanish) within the same session. Consistency in language input increases the likelihood of receiving responses in the intended language.
2. **Conduct multiple test runs prior to client presentation.** Rehearse the demo several times in the target language to anticipate LLM behavior, response accuracy, and potential variations.

Example of What *Not* to Do

The screenshot below illustrates an **incorrect approach**—mixing languages in a single thread. While it shows that the LLM can often understand and reply in the input language, this practice reduces consistency and should be avoided in client demos.
